

# Conditions Supported by **Right**<sup>™</sup>

**Rxight**<sup>™</sup> is the most comprehensive genetic test available to analyze your genetic profile and help your healthcare providers determine which medications are right for you. Our tests cover 200+ prescription and OTC medications, far more than any other pharmacogenetic test on the market.

**The Rxight**<sup>™</sup> test examines your DNA for indicators of how you might respond to certain medications, including those for:

- Acid reflux
- ADHD
- Anxiety
- Arthritis
- Asthma
- Blood clots
- Cancer
- Cholesterol
- Depression
- Diabetes
- Hypertension
- Pain
- Other conditions

*Trial and error to get my medications right... seriously?*

## Our Company

**Right**<sup>™</sup>  
Right Medicine.  
Right From the Start.

The **Rxight**<sup>™</sup> test was developed and is performed by MD Labs, a leading CLIA certified laboratory specializing in pharmacogenetic testing.

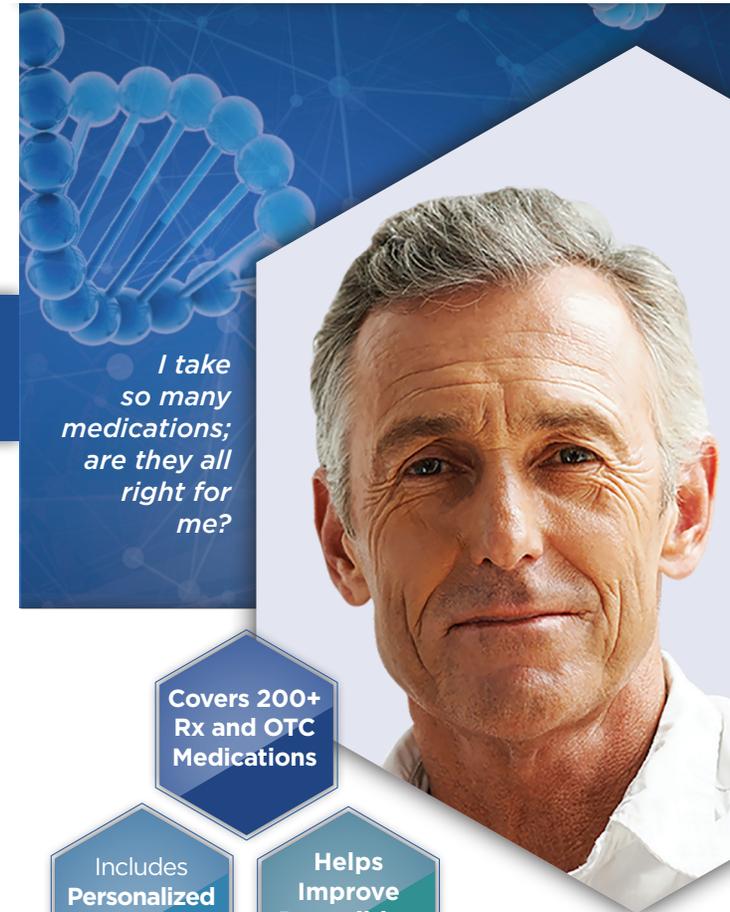

We empower patients and their providers by giving them better access to precision medicine so they can understand how their unique genetic profile affects the medications they take.

**This is precision medicine,  
the promise of the future realized.**

Do not discontinue or make any changes to your medication without first consulting your provider. Pharmacogenetic testing does not replace your provider's role in determining your medication therapy.

## The Most Comprehensive Pharmacogenetic Test for Prescription and OTC Drug Users

*I take so many medications; are they all right for me?*

Covers 200+ Rx and OTC Medications

Includes Personalized Medication Review<sup>®</sup>

Helps Improve Prescribing Accuracy

**Start with the right medication and dose**

so you can be confident about taking your prescription and OTC medications.

# What is **Right**™?

**Rxight**™ is a pharmacogenetic test that can help you and your healthcare providers understand which medications are right for you.

With a simple cheek swab, which your pharmacist sends to our lab, your DNA is analyzed and the results are available to your pharmacist in just a few days.

Employing the **Rxight**™ test to screen medications before therapy is initiated will help your physician avoid prescribing medications you won't metabolize well, and instead facilitate the right medication from the beginning.

*Could I have avoided any of those negative side effects?*

# Why is **Right**™ important?

Our bodies all process medications differently, based on our unique genetic profile. For example, a medication that's effective for one person may not be as effective or may cause dangerous side effects in another person.

# What is a **PMR**® and why is it important?

After your **Rxight**™ test results are available, your pharmacist will schedule an appointment to review the results with you. This session, called the Personalized Medication Review® (PMR), is included in the price of **Rxight**™.

During the PMR® session, your pharmacist will discuss the risks and benefits of your current and future medications, indicating which medications are right for you and which you should avoid, all based on your DNA profile. He or she may also make dosage recommendations that will be discussed with your physician.

Knowing which medication and dose are right makes all the difference, *for you and your family.*

**Rxight**™ helps your providers optimize your current and future medication therapy by steering you away from medications that could harm you and steering you towards treatment decisions that are right for you.

*Why is it so hard to get my dosing right?*

Ask your pharmacist to see how you can get started with **Rxight**.
